FHN FINANCIAL
CAPITAL ASSETS CORP.

INTRODUCTION

FHN Financial Capital Assets Corp. ("Capital Assets") is pleased to prepare for your review this comprehensive analysis of your single family mortgage loan portfolio investment.

Capital Assets recognized long ago that the average financial institution has dedicated considerable time, resources, and effort to managing the investment portfolio. In contrast, little information is available for the single family mortgage loan portfolio. With the mortgage portfolio, the focus is generally on servicing the loans and monitoring delinquencies, rather than analyzing the value and likely future performance of the mortgage portfolio.

This Portfolio Performance Analysis ("PPA") review is designed to provide senior management With the needed information to actively and effectively manage the 1-4 loan portfolio. Capital Assets has utilized the experience of its 25 full time CPA's, MBA's, and former lending institution employees to design the PPA to be as meaningful, informative, and useful as possible.

The three key issues that are addressed herein are :

- What Do I Own?
- What Is It Worth?
- What Is It's Likely Future Performance?

In the next several days, Capital Assets will contact you to arrange for a brief conference call to discuss our observations regarding your portfolio, as well as any recommendations we may have regarding its risk / return profile. Should you have any questions in the interim, please contact us at 800-456-5460.

DATABASE IDENTIFICATION AND TRIAL BALANCE

This section of the Portfolio Performance Analysis is designed to present an overview of the mortgage loan servicing system database provided to Capital Assets. The single family mortgage loan portfolio targeted for analysis has been segregated by removing non-single family assets or sold loans.

The targeted portfolio was then stratified by the major loan product types as perceived by the secondary mortgage loan market. These include breaks on rate type, amortization method, Mos to next rate adjustment, index type, and other relevant variables.

Finally, a few basic descriptive averages are provided for each product type to present management with a rough overview of the portfolio's composition, maturity profile, and average earnings rate. Also provided are average ARM descriptors, such as Mos to next rate adjust, margin, periodic rate caps, and lifetime rate ceilings.

WATERFALL LIQUIDITY FILTER ANALYSIS

This section of the Portfolio Performance Analysis is designed to provide management with an estimated general liquidity profile of the single family portfolio. In reality, the liquidity can only be determined through a loan level on site underwriting of the portfolio, but a good estimate can be determined via an analysis of the servicing database.

The Agencies and private mortgage loan investors employ a number of limits that identify a loan as purchasable. If the loan type falls within these limits, and the documentation of the loan is acceptable, the loan is eligible for purchase. By subjecting the servicing database to a waterfall "filter" analysis using these limits, the loans can be segregated into three liquidity profiles :

AGENCY GRADE

- The loan data meets all the general criteria for purchase by one of the Agencies, subject to a loan file documentation review.

PRIVATE GRADE

- The loan data fails one or more of the criteria for purchase by the Agencies, but it is acceptable for purchase by private investors, subject to a loan file documentation review.

PORTFOLIO GRADE

- The loan data fails one or more of the criteria for purchase in the standard mortgage loan secondary market. It may be a good credit risk and a performing asset, but, from an economic perspective, its profile indicates it should be retained in portfolio rather than sold in the secondary market.

By completing a liquidity profile of the portfolio, management can ascertain how easily the loans can be liquidated and determine the loans' value as well.

LOAN LEVEL PORTFOLIO PRICING ANALYSIS

Now that the portfolio has been identified, stratified, and filtered by liquidity grade, it is possible to estimate an answer to the question : What is it worth ?

Capital Assets interacts daily on a number of different levels with Agency purchasers of loans as well as private investors of non-agency grade mortgage assets. This section of the PPA applies this up-to-date knowledge base of required yields, pricing prepayment speeds, etc., to determine an estimate of the market value of your portfolio.

The valuation results are first presented on a product level basis, and then the valuation process is extended to a liquidity grade level. Finally, the portfolio is stratified from a "most profitable" to "least profitable" basis, and the portfolio is ranked in descending order. This provides management with an estimate of the maximum gain available from the portfolio as well as a maximum amount of liquidity available without a loss. Actual pricing will depend on results of a loan level due diligence, but this is intended to give management an estimate of value for analytical purposes.

INTEREST RATE VOLATILITY ANALYSIS

Now that the first two questions of what do I own and what is it worth have been addressed, the final question remains : What is it's likely performance in the future ? To answer this question, it is necessary to first point out two obvious facts :

- We don't know what interest rates are going to do in the future, and
- You can't manage the whole portfolio at once, because parts of it behave independently.

Facing these facts, Capital Assets designed this section of the PPA to address one of the parameters of a loan portfolio's future performance - the volatility of its market value with respect to the level of interest rates. Each segment of the portfolio is individually subjected to a rigorous + / - 300 basis point immediate rate shock, and the resulting impact on the segment's market value is examined. Finally, the entire portfolio is stratified on a loan level basis from most volatile to least volatile, allowing management to set a maximum acceptable volatility and then determine how much of the portfolio exceeds this limit.

One of the most important conclusions of this section of the PPA is usually that interest rate volatility varies widely from portfolio sector to sector, necessitating further volatility analysis on subsets of the portfolio in later sections of the PPA.

TOTAL FIXED RATE VOLATILITY ANALYSIS

This section of the Portfolio Performance Analysis continues to address the question : What is the portfolio's likely future performance ? Herein, the total fixed rate portfolio is subjected to further interest rate volatility analysis. This is usually one of the most rate sensitive sectors and further analysis is warranted.

In this section, the portfolio is rate shocked loan level up 100 basis points, and then again by 200 basis points, and the price drop is archived. The portfolio is then ranked loan level by the price drop in each scenario, and then it is stratified into eight strata by price drop. The change in price and change in weighted average life is then examined by individual strata.

By breaking the fixed rates into eight individual portfolios of loans, it is possible not only to quantify and compare the total amount of risk to the portfolio's future performance, but then to trace the risk back to the sectors creating that risk. With this information, management can identify and isolate sectors needing restructure, as well as which sectors if restructured would cause the greatest reduction in risk while affecting the fewest loans possible.

TOTAL ADJUSTABLE RATE VOLATILITY ANALYSIS

The third integral question the PPA began with was : What is the portfolio's likely future performance ? Fluctuations in the market value of the portfolio due to changes in interest rates is one of the critical aspects of this issue.

While most portfolio managers would likely perform interest rate stress tests on the fixed rate sector of the portfolio, few would stress the less volatile ARM sector. However, With the advent of fixed term ARMs in recent years, this is no longer a good rule of thumb. Certain fixed term ARMs have the interest rate risk equal to that of 15 year fixed rate loans, and Capital Assets recommends an interest rate stress test on this sector as well.

In this section, the ARM sector is rate shocked loan level up 100 basis points, and then again by 200 basis points, and the price drop is archived. The portfolio is then ranked loan level by the price drop in each scenario, and then it is stratified into eight strata by price drop. The change in price and change in weighted average life is then examined by individual strata.

PROJECTED YIELD ANALYSIS

The third integral question the PPA began with was : What is the portfolio's likely future performance ? Previous sections of the PPA have focused on future changes in the market value of the portfolio to answer this question, but now we shift our attention to the future yield of the portfolio.

A projected yield analysis is usually performed using broad buckets of loans which can produce distorted results. The Capital Asset's approach is to project, on a loan level basis, future prepayment activity and gross coupon for seven rate scenarios - up and down 300 basis points in 100 basis point increments. The results are then aggregated for three major sectors of the portfolio, which have differing potential for responses to rate shifts :

SHORT ROLL ARMS

- Adjustable rate loans with a next rate adjustment date of 1-12 months.

LONG ROLL ARMS

- Adjustable rate loans with a next rate adjustment date of more than 12 months.

FIXED RATES

- Loans whose interest rate does not adjust over time.

The end result is to view the future potential yield of the portfolio with an entirely new perspective … rate changes within sectors and their overall contribution to the whole portfolio.

COLLATERAL MARKET VALUE ("CMV") ANALYSIS

The Collateral Market Value Analysis of the PPA examines the estimated change in the market value of the collateral properties from the origination of the loans to present. In order to quantify changes in collateral values, Capital Assets utilizes two methods : Automated Valuation Model ("AVM") values or Case-Shiller indexed values.

AVM values are generally viewed by industry standards as the more accurate of the two methodologies, although AVMs must be obtained from third-party providers for a fee. Where AVMs have been obtained, Capital Assets has incorporated the AVMs in calculating an Updated loan-to-value. Capital Assets can assist in obtaining AVMs for a fee.

In the absense of AVMs, Capital Assets utilizes a geographically based property value index developed by Case-Shiller ("CS") to approximate changes in the collateral's value and trends therein over time. The CS Index utilizes repeat sales of individual properties as reported nationwide by county recorders to track trends in housing values on the zip code, county, MSA, state and census division levels where available. Where this data is unavailable, data from the Federal Housing Finance Agency ("FHFA") supplements the CS recorder data where necessary.

Once the collateral appraised values have been updated with AVMs or indexed to general geographic trends in housing values using the CS Index, a number of extremely useful analyses are conducted, including :

- **Market Value Trends by Geographic Region**
- **Market Value Trends by Origination Year**
- **Market Value Trends by Product Type**
- **Stratification of Current Collateral Deficiency or Excess**
- **Stratification of Estimated Value Changes**

COLLATERAL VALUE UPDATE SUMMARY

CASE-SHILLER ("CS") INDEXED VALUES

If the customer did not provide recent collateral values, collateral values for each of the loans in the portfolio were adjusted for changes in market value since origination based on comparative sales data for similar collateral located in the same geographic area. Capital Assets utilized the Case-Shiller ("CS") Index of housing prices as a source of comparable historical sales data

360 + Metropolitan Statistical Areas ("MSA's"), 50 States and 9 Census Divisions.

Percent of Loans Updated With CS Indexed Values = 100 %

AUTOMATED VALUATION MODEL / BROKER PRICE OPINION VALUES

If the customer provided updated collateral values based on an Automated Valuation Model ("AVM's") or Broker Price Opinons ("BPO's), these values were utilized rather than a Case Shiller based indexing of value as they are usually more accurate. AVM's are based on a mathematical valuation model utilizing recent sales data, local economic conditions, etc., whereas BPO's are opinions of value from a licensed real estate appraiser. AVM's and BPO's are provided by third party vendors for a per loan charge, and Capital Assets can assist in obtaining either on a consulting fee basis.

Percent of Loans Updated With AVM or BPO Values = 0 %

COLLATERAL VALUE NOT UPDATED

Percent of Loans Unable To Be Updated With CS Indices, BPO's, or AVM's = 0 %

CASE SHILLER UPDATE METHODOLOGY

LOAN PORTFOLIO'S GEOGRAPHIC PROFILE

The portolio's collateral properties were analyzed based upon the database provided by your institution.

This analysis concluded the portfolio's collateral was geographically distributed as follows :

334 Zip Codes,

152 Counties,

91 MSA's,

and 40 States.

LOAN PORTFOLIO MAPPED TO CASE-SHILLER

If updated values were not provided by the customer, collateral values for each of the loans in the portfolio were then adjusted for changes in market value based on comparative data for similar collateral located in the same geographic area. Because of state laws that limit the availability of comparative data in public records, data is not always available down to the most granular level (zip code). For properties located in those areas, we substitute the next most location specific source: by county, then by MSA, and lastly by state. Of the loans mapped to CS, the resulting geographic sources of changes in value for your portfolio were as follows :

69% by zip code,

12% by county,

18% by MSA,

2% by state,

0% not located.

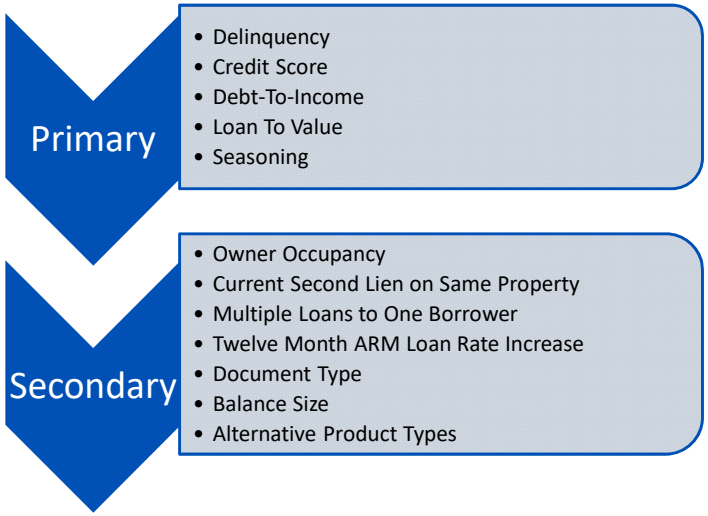
CREDIT RISK LAYERING ANALYSIS

The Credit Risk Layering Analysis (CRLA) begins by assessing the relative credit risk of the portfolio along primary risk variables : Delinquency, Credit Score, Loan-To-Value, Debt-To-Income, and Seasoning. For each primary variable, the portfolio is segregated into Low, Medium, and High risk bands.

Next, these primary variables are cross analyzed against multiple potential secondary variables :



This analysis is intended as a binary analysis, and is not intended to be a weighted average analysis. Thus, some of the variables may in fact carry more weight than others in predicting future loan performance. This analysis does not attempt to predict future loan performance, but rather analyzes the presence of certain risk types and product types within your portfolio.

JUMBO MORTGAGE DRILLDOWN

This section of the Mortgage Portfolio Performance Analysis focuses exclusively on mortgage loans whose original balance exceeds the Agency maximum for purchase, or what are otherwise known as jumbo balance loans. The analysis is intended to be comparative in nature, focusing on the relative credit, performance, and collateralization levels of your portfolio's conforming versus jumbo mortgages.

A partial listing of the reports in the section include a :

- **Reconciliation By Balance**
- **Composition Overview by Balance**
- **CRLA Analysis by Balance**
- **CMV Analysis by Balance**
- **Waterfall Filter Analysis by Balance**
- **Estimated Gain / Loss by Balance**

CASE-SHILLER REPEAT SALES INDEX

For years, researchers, appraisers, and lending institutions relied on "median sales prices" in given geographic areas to measure price movements in the housing market. The median can be a very unreliable indicator of actual price changes through time. Since the median is simply the "middle" value of a set of houses that happen to sell during a given period of time, it can

Due to the inherent flaws in median sales price indices in measuring housing price movements, FHNCAC utilizes the SandP CoreLogic Case-Shiller ("CS") Index of housing prices which is a registered product of Standard and Poors Corporation.This index is the most accurate and widely used measure of housing price changes in specific market areas. It is based on recorded changes in the value of individual housing units in arms length transactions. All properties that sell in a given month or quarter are screened for previous sales of the same property, and it is thus referred to as a "repeat sales index".

The Case-Shiller Index Set is designed to provide maximum historic and geographic coverage by combining the Case-Shiller Index and the FHFA home price indexes. Where available the CS Index includes data on repeat sales of housing in all 43,000 + Zip Codes, 3,148 Counties, 360 + Metropolitan Statistical Areas ("MSA's"), 50 States and 9 Census Divisions. Foreclosures are included. January 2000 indices are set at 100, although data goes back to January 1987. In some states, state law prohibits the release of county recorder property transaction information due to privacy concerns. Where county recorder information is unavailable, FHFA indexes are included for MSA, State and Census Divisions. This ensures that a measure of housing values is available in most geographical areas at the most localized level possible.

The Case-Shiller Index is a registered trademark of S&P CoreLogic.
